

# Triazine Herbicides

Triazine herbicides are the most heavily used agricultural chemicals in the United States. They are used to control broadleaf weeds primarily for corn and soybeans.

A number of studies have shown that atrazine is an endocrine disruptor, causing damage to reproductive systems in frogs, fish and other wildlife. Potential health hazards to people and a negative environmental impact lead to the banning of atrazine in the European Union (EU) in 2005.

The controversy over potential human health hazards, resulting from the use of atrazine and other triazine herbicides has renewed an interest in analyzing these compounds.

AccuStandard offers a comprehensive product line of these compounds as well as a number of metabolites.
